

IMPROVES

CROP PERFORMANCE AND YIELD

UNDER ALL TYPES OF ENVIRONMENTAL CONDITIONS

- **HEAT STRESS**
- **DROUGHT STRESS**
- **SALINE AND/OR HIGH SALT SOILS**
- **COLD TOLERANCE EARLY OR LATE SEASON**

Heat Shield is four strains of *Trichoderma harzianum* that also shows yield advantages even without stress (70% win rate).

In addition, there is an additive effect when used in conjunction with other biologicals, such as Nutri-Cycle.

IMPROVES

CROP PERFORMANCE AND YIELD

Stress Guard is a new product containing several microscopic fungi that establish a symbiosis with crop plants to enhance plant tolerance against hot, cold and dry conditions, as well as highly saline or salty conditions in soil. Stress Guard was developed based on more than 20 years of scientific research to determine how plants in nature adapt to stress. Years of research has discovered that in extreme environments, nature has adapted certain strains of fungi that form symbiotic associations with plants. This symbiotic relationship allows the two organisms to survive together, whereas the individual organisms would not be able to live.

Stress Guard treated crops increase crop yields and average of 2-6% in normal environmental conditions. However, during high stress growing seasons, Stress Guard treated fields increases crop yields an average of 10-50%.

Stress Guard can be applied as a seed treatment or mixed with fertilizer for in-furrow application. Five years of field testing have demonstrated that Stress Guard has been shown to increase crop yields by an average of 26% under drought, salinity and temperature stress.

2013-2016 Field Evaluation of Stress Guard on Corn Hybrids in the Absence of Stress
 Average Yield Increase: + 6.4 bu/acre
 Win Rate: 69%

THESE SEED AND PLANT TREATMENT PRODUCTS HAVE BEEN DEVELOPED TO:

- 1 - Increased abiotic stress tolerance
- 2 - Increased water and nutrient efficiency
- 3 - Increased nutritional value
- 4 - Increased crop yield & yield quality
- 5 - Improved seed germination
- 6 - Enhanced seedling growth and development
